1. INTENDED USE

Influenza antiserum reagent 11/206 is prepared for single radial diffusion assay of A/Perth/16/09-like antigens using an appropriate NIBSC antigen reagent.

The antiserum reagent was prepared in sheep 548, 549, 550 and 551 to the purified HA of A/Perth/16/09-like (NIB65 and NYMCX-187) influenza strains. The HA antigens were extracted from purified virus by treatment with bromelain and purified by sedimentation on sucrose gradients (Brand, GN and Skehel, JJ, Nature, New Biology, 1972, 238, 145-147).

2. CAUTION

This preparation is not for administration to humans or animals in the human food chain.

The material is not of human or bovine origin. As with all materials of biological origin, this preparation should be regarded as potentially hazardous to health. It should be used and discarded according to your own laboratory’s safety procedures. Such safety procedures should include the wearing of protective gloves and avoiding the generation of aerosols. Care should be exercised in opening ampoules or vials, to avoid cuts.

3. UNTAGE

No unitage is assigned to this material.

4. CONTENTS

Country of origin of biological material: United Kingdom.

The immunization schedules for both sheep 548 and 549 were as follows: One dose of approximately 50µg of A/Victoria/210/2009 (NIB65) HA with Freund’s Complete Adjuvant (FCA) was given intramuscularly, followed two weeks later with a 10 microgram dose of including Freund’s Incomplete Adjuvant (FIA). Ten further 10 microgram doses of A/Victoria/210/2009 (NIB65) HA including FIA were given at weekly intervals. Twelve weeks after the initial immunization, serum was collected and sodium azide (0.05% w/v) added. The sera were then treated by an APHIS approved method for the inactivation of FMDV.

The schedule for sheep 550 and 551 to the purified HA of A/Perth/16/09-like (NIB65 and NYMCX-187) influenza strains. The HA antigens were extracted from purified virus by treatment with bromelain and purified by sedimentation on sucrose gradients (Brand, GN and Skehel, JJ, Nature, New Biology, 1972, 238, 145-147).

5. STORAGE

The recommended storage temperature is +2-8°C. However, if it is intended to store the reagent for long periods i.e., >2years, they may be stored at -20°C. The antiserum can be frozen and thawed without any adverse impact on use in the SRD assay.

6. DIRECTIONS FOR OPENING

Vials have a screw cap; an internal stopper may also be present. The cap should be removed by turning anti-clockwise. Care should be taken to prevent loss of the contents. Please note: If a stopper is present on removal of the cap, the stopper should remain in the vial or be removed with the cap.

7. USE OF MATERIAL

For the assay of antigens containing 20-50 micrograms of HA activity in 1ml, approximately 12µl of the undiluted reagent should be added to 1ml agarose. It is necessary to change the antiserum concentrations according to local laboratory conditions. Antiserum Reagent 11/206 should be used according to the method described by Wood, JM, Schild, GC, Newman, RW and Seagroatt, VA. Journal of Biological Standardisation, 1977, 5, 2.

8. STABILITY

It is the policy of WHO not to assign an expiry date to their international reference materials. They remain valid with the assigned potency and status until withdrawn or amended.

Reference materials are held at NIBSC within assured, temperature-controlled storage facilities. Reference Materials should be stored on receipt as indicated on the label. Once reconstituted, diluted or aliquoted, users should determine the stability of the material according to their own method of preparation, storage and use.

NIBSC follows the policy of WHO with respect to its reference materials.

Users who have data supporting any deterioration in the characteristics of any reference preparation are encouraged to contact NIBSC. Reference materials are held at NIBSC within assured, temperature-controlled storage facilities. Reference Materials should be stored on receipt as indicated on the label.

VETERINARY CERTIFICATE OF ANIMAL HEALTH

This is to certify that I have examined a Sheep with ear tag number: UK 028 8289 1346 [Virology no. SH548], which has been used in the production of blood antiserum between 20th July 2011 and 19th October 2011. Both the ear tag number and the animals' record show that it is of UK origin.

This animal was a breeding ewe which became surplus to requirements. In my opinion at the time of clinical examination, the ewe was in good health and showed no clinical signs of infectious disease.

Foot and Mouth Disease Virus Inactivation Certificate

This is to certify that serum collected from Sheep no. UK 028 8289 1446 [Virology no.SH 548] has been treated by an APHIS approved method for inactivation of Foot and Mouth Disease Virus. The treatment method used was maintenance of pH5.5 or lower for a minimum of 30 minutes.

VETERINARY CERTIFICATE OF ANIMAL HEALTH

This is to certify that I have today examined a sheep with ear tag number: UK 028 8289 8149 [Virology no. SH550], which has been used in the production of blood antiserum between 5th October 2011 and 2nd November 2011. Both the ear tag number and the animal’s record show that she is of UK origin.

This animal was a breeding ewe which became surplus to requirements. In my opinion at the time of clinical examination, the ewe was in good health and showed no clinical signs of infectious disease.
